

# Long Drop

Plan

The Long Drop is a no-cost, no-impact composting toilet made for and by Invisible Studio to serve their woodland studio. It was made entirely from scavenged material and cost nothing to build.

The toilet separates solids and urine just below the seat. Urine is used as fertilizer, while solids are captured via a series of stacked (donated) wheelie bins, and will be used as fertilizer after 12 months.

The toilet was designed around available material. The studwork, battens and sheet material were all left over from other projects. The poles were cut on site, and braced with offcuts from steel black bar bracing used for the practice's studio. The flashing piece at the ridge was left over from Invisible Studio's Moonshine house close by, and the polycarbonate for the door and the black fibre cement tiles were scavenged from skips.
